The Causes and Consequences of Cancer Health Disparities

Bríd M. Ryan, PhD, MPH Laboratory of Human Carcinogenesis, Center for Cancer Research, NCI ryanb@mail.nih.gov

TRACO 2019

Overview

Part 1: Discussion of key cancer health disparities in the US

Part2: Discussion on key factors that contribute to disparities

Race and Ethnicity

Race: Biological differences between groups assumed to have different bio-geographical ancestries or genetic makeup

Ethnicity: A multi-dimensional construct reflecting biological factors, geographical origins, historical influences, shared customs, beliefs and traditions among populations that may not have common genetic origin

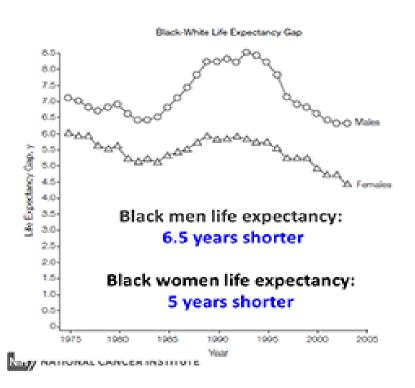

Both are important factors to consider in trying to research, understand and diminish cancer disparities

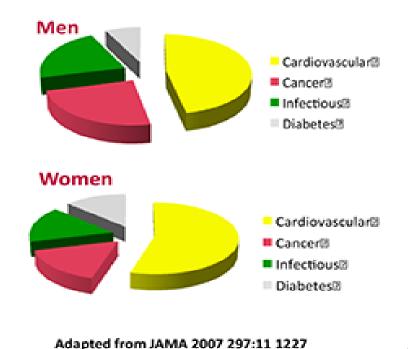

Health Disparities in the United States

Health Disparities in the United States

Racial differences in life expectancy in the United States

Contributing Factors

Cancer Disparities: Definition

The NCI defines "cancer health diaparities as:

"differences in the incidence, prevalence, mortality and burden of cancer and related adverse health conditions that exist among specific population groups in the United States" Cancer Disparities: Definition Excess Burden of Cancer in the African-American Community

African-Americans have the highest death rates from all cancer sites combined, and from malignancies of the lung, colon and rectum, breast, prostate, and the cervix of all racial groups in the united States"Incidence Rates by Race/Ethnicity and Sex, U.S., 1999-2012

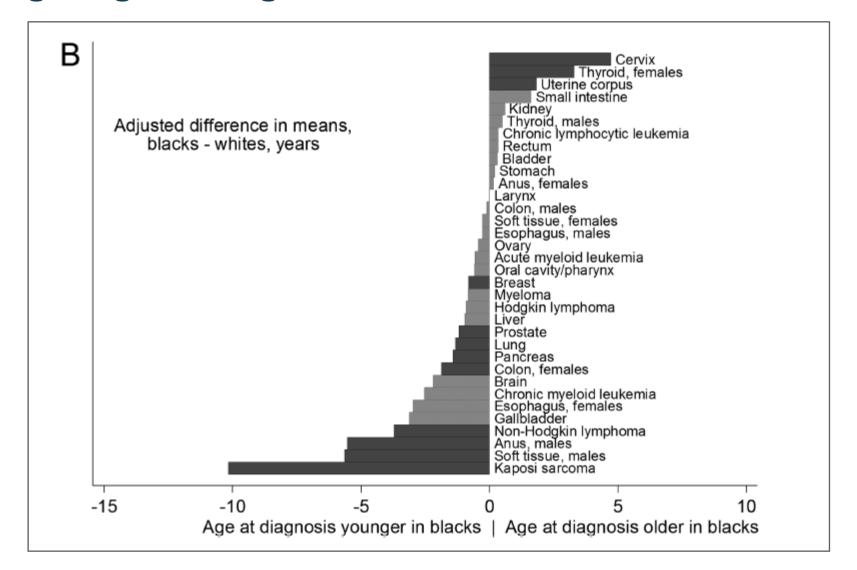

Cancer disparities

Cancer Disparities

Younger age at diagnosis for most cancers

Younger age at diagnosis for most cancers

Cancers mainly diagnosed at younger age in black men and women NHL, anal cancer, Kaposi sarcoma and soft tissue

Etiologic heterogeneity

Cause of the cancer differs across groups, causes cancer at different ages Subtypes can be caused by different factors – can contribute to disparities

Timing or intensity of exposure

For example, exposure to tobacco could occur earlier in one population

Timing, prevalence and frequency of early cancer detection Screening, or through follow after an incidental finding

NCI Early Onset Malignancy Initiative

The Center for Cancer Genomics (CCG) in collaboration with the Division of Cancer Prevention's NCI Community Oncology Research Program (NCORP) invited the twelve Minority/Underserved NCORP sites to participate in this project

^s Cancer Health Disparities: Second cancers

African Americans also have a higher risk of certain second cancers

Site-specific risk of second primary cancer in women with endometrial cancer according to race (1973-2007)

Second Cancer Site	White $(n = 10,584)$	Black $(n = 463)$	
	SIR (95% CI)	SIR (95% CI)	
All sites $(N = 11,047)$	0.85 (0.84-0.87)	1.19 (1.08-1.31)	
Solid tumors $(N = 9744)$	0.85 (0.83-0.87)	1.19 (1.08-1.31)	
Digestive system $(N = 2854)$	0.97 (0.93-1.01)	1.37 (1.16–1.61)	
Colon and rectum $(N = 1949)$	1.02 (0.97–1.07)	1.53 (1.24-1.87)	
Liver $(N = 40)$	0.58 (0.41-0.80)	1.17 (0.32-2.99)	
Pancreas $(N = 356)$	0.88 (0.79-0.98)	0.97 (0.56-1.55)	
Respiratory system $(N = 1382)$	0.72 (0.68-0.76)	1.09 (0.84-1.39)	
Breast $(N = 3448)$	0.98 (0.95-1.01)	1.01 (0.82-1.23)	
Female genital system $(N = 448)$	0.65 (0.59-0.71)	1.48 (1.03-2.07)	
Urinary system $(N = 801)$	1.19 (1.11–1.28)	1.80 (1.25-2.52)	

Digestive system: esophagus, stomach, small intestine, colon and rectum, liver, gallbladder, and pancreas.

Respiratory system: lung and bronchus.

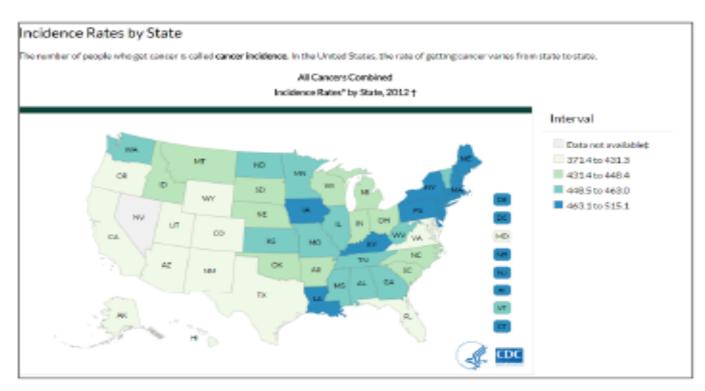

Female genital system: ovary, cervix, vagina, and vulva.

Urinary system: urinary bladder, ureter, kidney, and renal pelvis NATIONAL JOHRNAL OF GYNECOLOGICAL CANCER

Geographical factors

Geographical factors contribute to cancer disparities

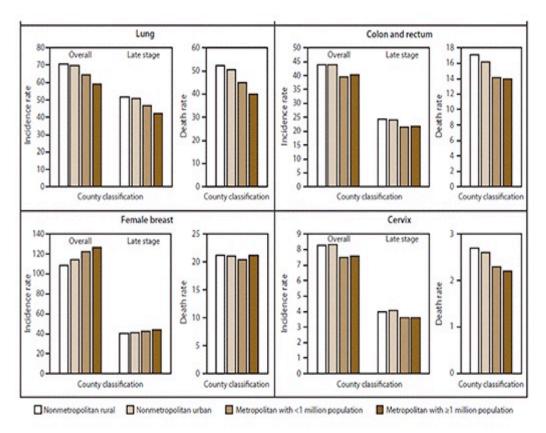

Highest Kentucky Rhode Island Delaware Louisiana New Jersey

Lowest New Mexico Arizoma Wyoming Alaska Virginia

Rural-urban disparities

Rural-Urban Disparities in Cancer Mortality

Geographical factors

Geographical factors contribute to cancer disparities

- A low socioeconomic status (SES) neighborhood confers additional incidence or mortality risk beyond individual SES (J. Epidemiol. Community Health 2003, 57:444-52)
 - Unequal burden of pollution
 - Access to preventative services (eg tobacco cessation)
 - Areas with the highest percentage of African Americans have the highest exposure to cancer-associated pollutants (Environ Health Perspect. 2005 113(6): 693–699)
- Rural populations are more likely to have increased cancer incidence, unequal burden of pollution
 - Forego medical care and prescriptions due to cost
 - Report fair/poor heath and health-related unemployment
 - Experience psychosocial distress

Rural-urban disparities in cancer incidence

Rural-Urban Disparities in Cancer Incidence

- Rural cancer disparities included higher rates of tobacco associated, HPV associated, lung and bronchus, cervical and colorectal cancers across most population groups.
- HPV-associated cancer incidence rates increased in rural areas (APC=0.724, p<0.05) while temporal trends remained stable in urban areas.
- Cancer rates associated with modifiable risks tobacco, HPV, and some preventive screening modalities (e.g. colorectal and cervical cancers) - were higher in rural compared to urban populations.
- Impact: Population-based, clinical, and/or policy strategies and interventions that address these modifiable risk factors could help reduce cancer disparities experienced in rural populations.

Palmer NR et al, Cancer Epidemiol Biomarkers Prev, 2013. Weaver KE et al., Cancer Causes Control, 2013. Weaver KE et al., Cancer, 2013. Zahnd et al. CEBP 2017

Rural-Urban disparities

Rural-Urban Disparities in Cancer Incidence

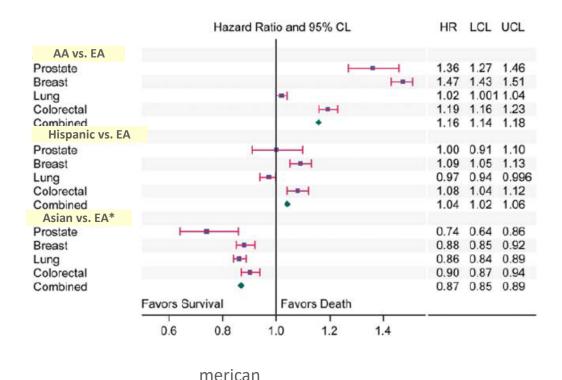

- The U.S. Preventive Services Task Force recommends population-based screening for colorectal, female breast, and cervical cancers among adults at average risk for these cancers and for lung cancer among adults at high risk
- Screening adults for tobacco use and excessive alcohol use, offering counseling and interventions as needed; and using low-dose aspirin to prevent colorectal cancer among adults considered to be at high risk for cardiovascular disease based on specific criteria.
- Recommendation for vaccination against cancer-related infectious diseases including human papillomavirus and hepatitis B virus.
- The Guide to Community Preventive Services describes program and policy interventions proven to increase cancer screening and vaccination rates and to prevent tobacco use, excessive alcohol use, obesity, and physical inactivity.

Survival Health Disparities by Cancer Site

African Americans have the highest rate of cancer specific mortality

Racial differences are not reducing over time (overall)
Breast cancer—disparities might be increasing
Prostate cancer—disparities might be improving

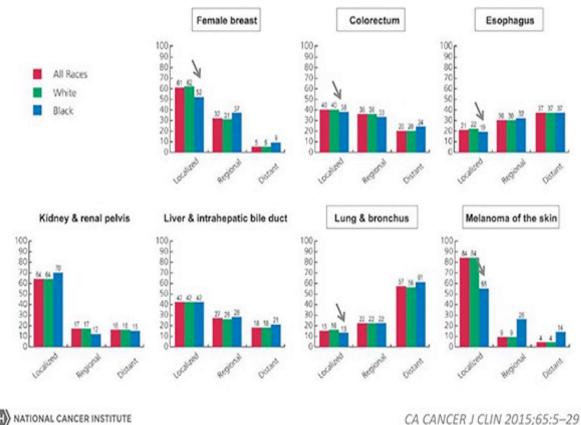

r

Disparities in cancer mortality

Some of the reasons for disparities in cancer mortality: Lack of early detection?

24

➤ Some of the reasons for disparities in cancer mortality: Access to screening?

Possibly for some cancers

Breast cancer mammography use similar in equal access to care setting (Cancer 2013 Oct 1;119(19):3531-8)

Colorectal cancer screening is lower among African Americans even in an equal access to care setting (Cancer. 2013; 4(3): 270–280)

Uptake of screening for other cancers, such as HPV, may also be lower in minority populations

But the differences exist even in cancers where there is no validated screening modality (liver, esophagus, etc)

Lung cancer screening

Lung Cancer Screening

Table 2 Numbers and per cent of lung cancers diagnosed in the NCI-MD case-control study from 1998 to 2015 that fall within guidelines for lung cancer screening

Abbreviations: NA, not applicable; SCCS, Southern Community Cohort Study; USPSTF, United States Preventive Services Task Force.

^a Categories are not mutually exclusive.

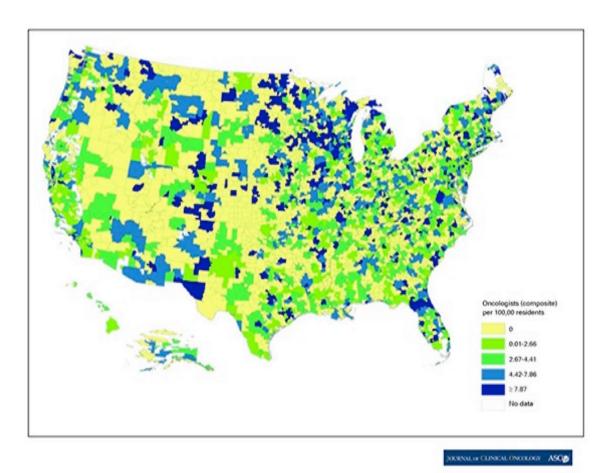

Access to screening

Some of the reasons for disparities in cancer survival: Access to screening?

- Barriers to screening include residence in a rural area and access to screening services
- Uptake of screening for other cancers can vary
 - Breast cancer mammography use similar in equal access to care setting (Cancer 2013 119(19):3531-8)
 - Colorectal cancer screening is lower among African Americans even in an equal access to care setting (Cancer. 2013; 4(3): 270–280)
 - Lung cancer screening similar to lower among African Americans
 - Specificity of screening criteria
- But mortality differences exist even in cancers where there is no validated screening modality (liver, esophagus, etc)

Oncologist map

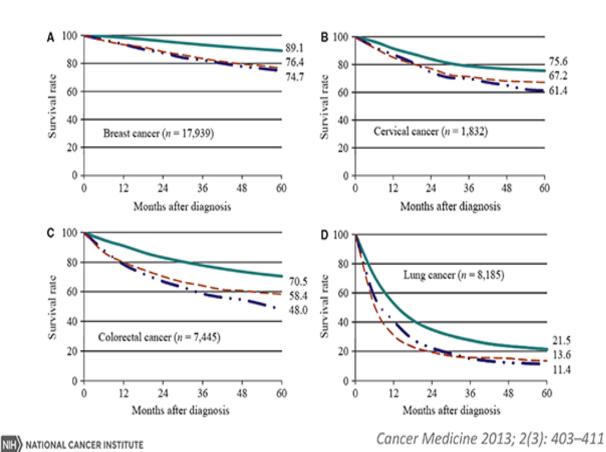

Oncologists per 100,000 residents by hospital service area

Access to care

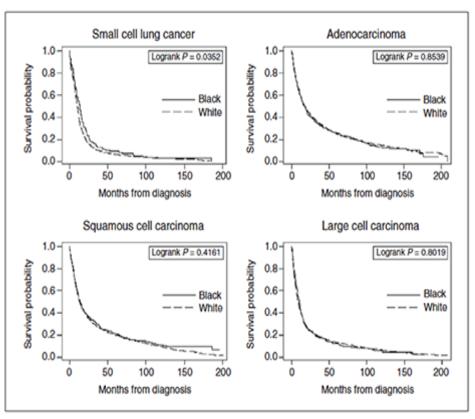

Some of the reasons for disparities in cancer mortality: Access to care?

Access to care

Some of the reasons for disparities in cancer mortality: Access to care?

Cancer Epidemiol Biomarkers Prev; 21(10) 2012

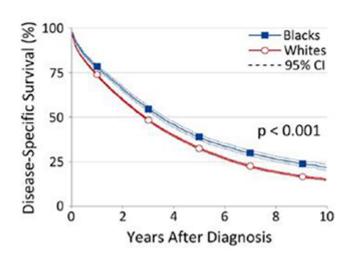

Access to care

Some of the reasons for disparities in cancer mortality: Access to care?

Multiple myeloma

Increased incidence among African Americans but adverse disparities in outcome not observed African Americans may have a more indolent form of MM

AA patients with myeloma have better survival than EA patients

Waxman et al. Blood 2010

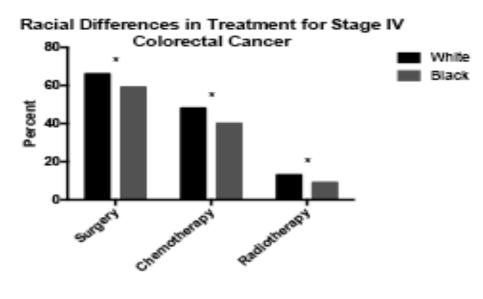

29

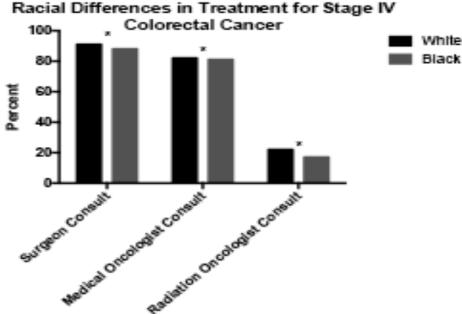

Care versus quality care

Similar access to care alone does not equate to equal access to quality care

In a "regular" medical setting, studies show that racial disparity in specialist consultation, as well as subsequent treatment with multimodality therapy for metastatic colorectal cancer, exists.

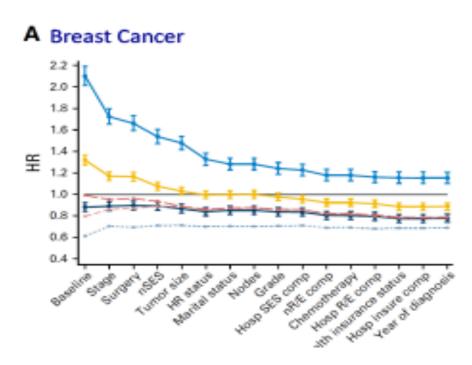

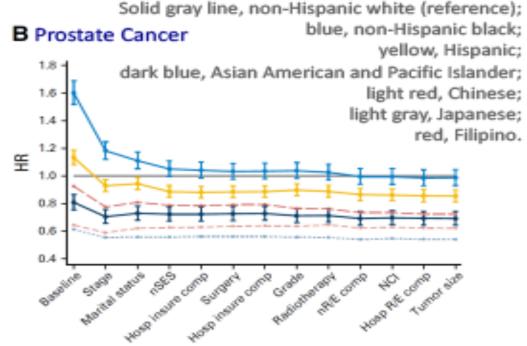

Factors affecting disparities

Factors affecting disparities in cancer survival

"Stage at diagnosis had the largest effect on racial/ethnic survival disparities, but earlier detection would not entirely eliminate them. The influences of neighborhood socioeconomic status and marital status suggest that social determinants, support mechanisms, and access to health care are important contributing factors."

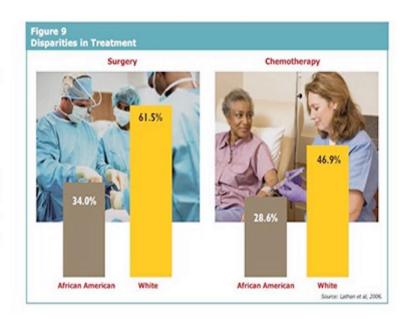

Uptake of care

Some of the reasons for disparities in cancer mortality: Access and uptake of care?

- Even among those with medicare, AA are less likely to receive treatment for lung cancer (Cancer 2008 112 900-908)
- African American renal cancer patients are less likely to receive surgical treatment (nephrectomy) and die more often from competing causes than European American patients (J Clin Oncol 2007, 25: 3589 – 3595)

ALA - Too Many Cases Too Many Deaths 2010

Uptake of care

Some of the reasons for disparities in cancer mortality: Access and uptake of care?

TABLE 4. Multivariate regrodds of treatment among a stage, age, and sex

Breast conserving (n = 3154)					
25th	0 (0 to 0)	0 (0 to 0)	0 (0 to 0)	0 (-0.4 to 0.4)	
50th	18 (16.9 to 19.1)	19 (16.5 to 21.5)	1.0 (-2.0 to 4.0)	2.0 (0.0 to 4.0)	
75th	31 (29.2 to 32.8)	33 (30.1 to 35.9)	2.0 (-1.5 to 5.5)	3.5 (0.9 to 6.1) ^b	
90th	48 (45.5 to 50.5)	57 (49.1 to 64.9)	9.0 (-0.7 to 18.7)	7.9 (3.6 to 12.1 ^b	
Mastectomy (n = 1733)					
25th	15 (14.2 to 15.8)	14 (12.5 to 15.5)	-1.0 (-2.8 to 0.8)	-0.3 (-3.5 to 2.8)	
50th	26 (24.4 to 27.6)	29 (25.7 to 32.3)	3.0 (-0.7 to 6.7)	2.0 (-0.8 to 4.9)	
75th	43.5 (40.4 to 47.6)	64 (52.2 to 75.8)	20.0 (5.7 to 34.3) ^b	4.1 (-0.1 to 8.5)	
90th	102 (86.5 to 117.5)	149 (125.9 to 172.1)	47.0 (24.2 to 69.8) ^b	9.2 (0.8 to 17.5)b	

This study's results indicate that time to breast cancer surgery was delayed for NHB compared with NHW women in the Military Health System. However, the racial differences in TTS did not explain the observed racial differences in overall survival among women who received breast-conserving surgery.

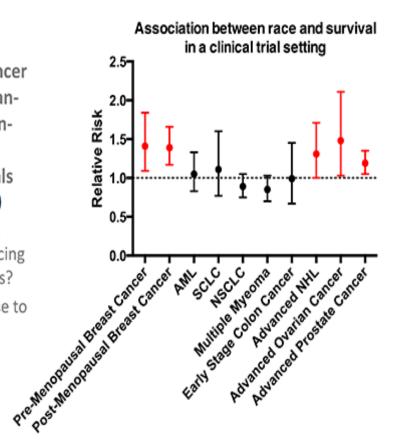

Model adjusted for age, marital status, active duty status, military service/sponsor branch, care source, benefit type, TRICARE region, year of diagnosis, tumor stage, tumor grade, hormone receptor status, preoperative chemotherapy or radiotherapy, and comorbid conditions. (See the Study Variables subsection of the Methods section for a description of the variable levels.)

bp < .05.</p>

Is biology a contributing factor

Is biology a contributing factor?

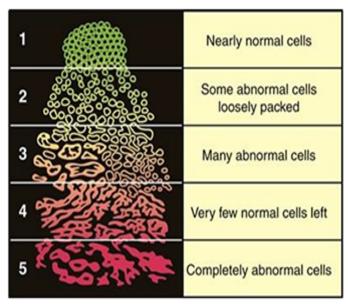

- Racial disparities in prostate and breast cancer survival between African-American and European-American persist in randomized clinical trials (JNCI 2009, 101: 984 – 92)
 - Intrinsic differences in tumor biology influencing disease aggressiveness?
 - Differences in response to therapy?

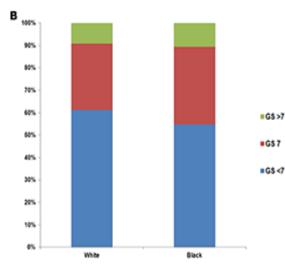

Prostate cancer

African Americans are more likely to be diagnosed with Aggressive Prostate Cancer

Genetic susceptibility

Racial differences in prevalence of 8q24 prostate cancer susceptibility variants (\sim 50%) Admixture mapping identified 8q24 as a locus of increased risk for African-American men when compared to European-American men (*PNAS 2006, 103: 14068-73*) Risk alleles are more common among African-American men, leading to the highest population attributable risk conferred by 8q24 in this population (*Nat Genet 2007, 39: 638 – 44 & 954 – 6*)

Excess of African ancestry at 8q24 (Hum Genet 2009 Nov;126(5):637-42)
Risk variants rs114798100 and rs111906923 are only found in men of African descent (JNCI 2016 108 (7))

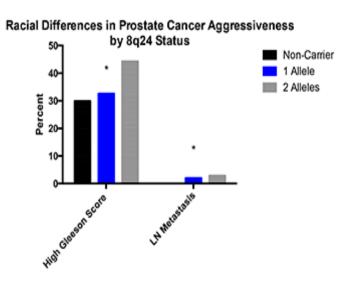

Racial differences in prevalence of 17q21 prostate cancer susceptibility variants (~ 10%) Risk alleles of a new locus, rs7210100 are more common in populations of African descent (*Nat Gen 2011, 43: 570-573*)

Germline genetics

Germline Genetics

- 8q24 is associated with higher grade, more aggressive prostate cancers
 - Risk alleles are more common among AA men, (Powell et al., J Urology 2010, 183: 1792 – 7)
- Faster disease progression in AA men (vs. EA men) (Powell et al., J Urology 2010, 183: 1792 7)

≻Germline Genetics

Increased proportion of Native American ancestry is associated with increased risk of childhood acute lympoblastic leukemic

Screening implications

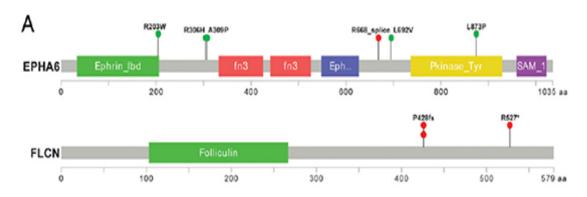

Also related to treatment—Children with more than 10% Native American ancestry need an additional round of chemotherapy to respond to the treatment (Yang et al., Nature Genetics 2011 43(3); 237-241)

Ancestry informative markers provide a greater granularity to studying race in genetic and genomics studies

Somatic genetics

Somatic Genetics

 Global heterogeneity in acquired mutational events in prostate tumors:
 Evidence of a different disease etiology?
 (Cancer Res 2010, 70: 5207 – 12; Prostate 2011, 71: 489 – 97; Urology 2012, 80: 749 – 53; Clinical Cancer Res 2014, 20: 4925 – 34)

- High frequency of oncogenic TMPRSS2:ERG gene fusion events in European/European-American patients (about 50%), intermediate frequency in African-American patients (24%-31%), but rather uncommon in Asian patients (2%-16% among Chinese, Japanese patients)
- Common PTEN loss in European/European-American patients (30%-50%) but uncommon in Asian and African-American patients (5%-15%)

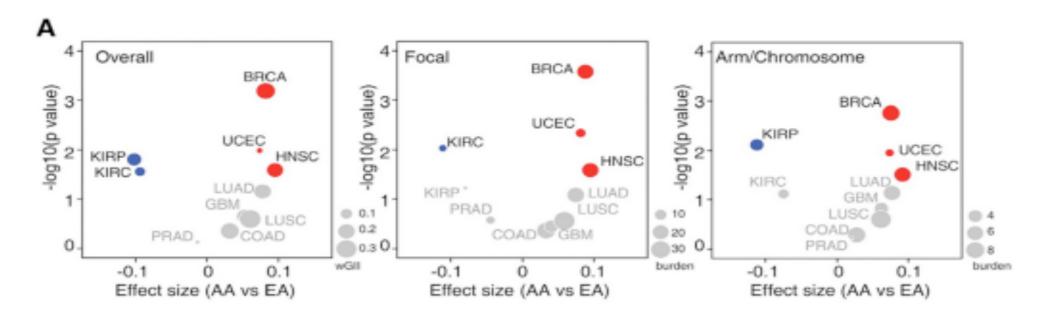

Somatic genetics

Somatic Genetics

- Breast, head and neck, and endometrial cancers of African Americans have higher levels of chromosomal instability than those of European Americans
- The frequency of genetic alternations in the PI3K pathway in AA patients is lower

Transcriptome, molecular subtype

Transcriptome, molecular subtype

- Population differences in molecular subtypes and disease grade
- Race/ethnic disparity in prevalence of basal-like/triple-negative breast tumors (JAMA 2006, 295: 2492 – 2502; J Clin Oncol 2009, 27: 4514 – 21; CEBP 1994, 3: 127-135)

Lymph node only metastases, yes vs no	0.79 (0.63-0.99)	.044
Visceral metastases, any va none	1.30 (0.95-1.78)	.098
Prior docetaxel/cabazitaxel, yes vs no	1.54 (1.25-1.90)	<.001
Prior abiraterone/enzalutamide, yes vs no	1.53 (1.16-1.27)	<.001

Abbreviations: ALP, alkaline phosphatase; CI, confidence interval; ECOB, Eastern Cooperative Oncology Group; HR, hazard ratio; PROCEED, PROVENGE Registry for the Observation, Collection, and Evaluation of Experience Data; PSA, prostate-specific antigen.

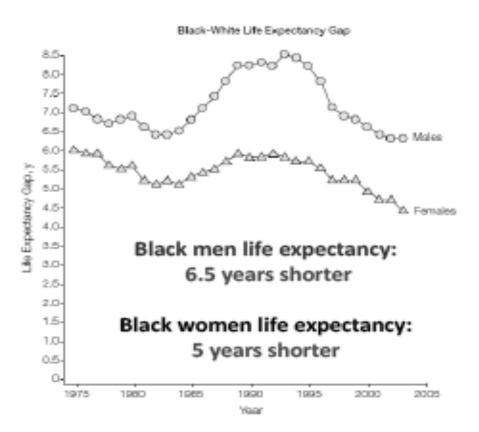

*Multivariable Cox modeling.

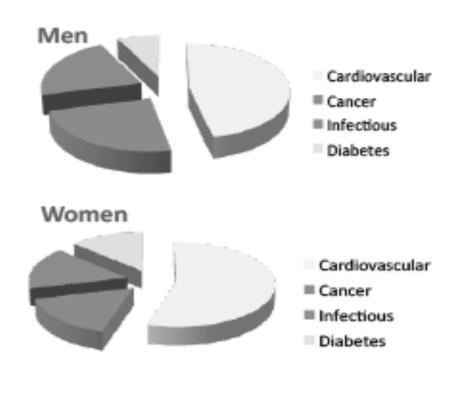

Health disparities

Health Disparities in the United States

Racial differences in life expectancy in the United States

Contributing Factors

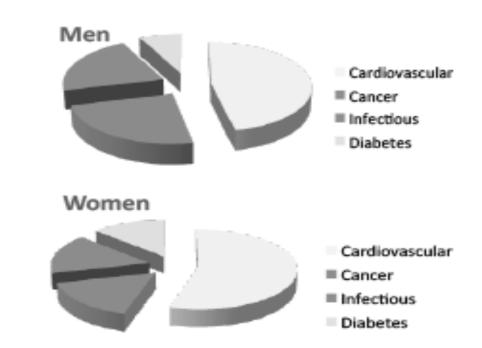

Health disparities in the U.S.

Health Disparities in the United States

Contributing Factors

- Complex web of factors that contribute to disparities in incidence and survival
 - Host (biology)
 - Environment (SES, geography)
 - Behavior (smoking, diet, beliefs)

Key determinants

Key determinants of disparities

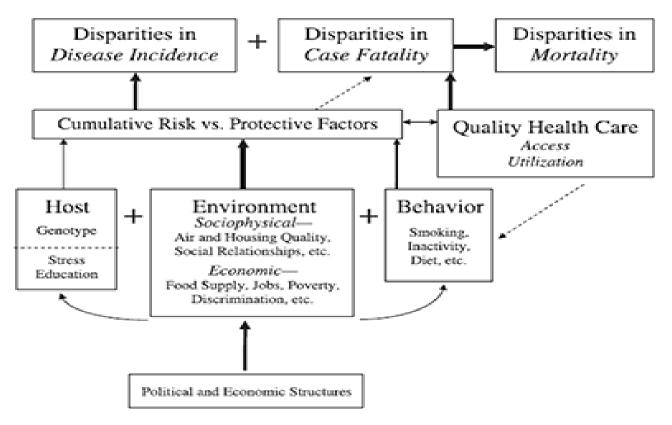

Figure 1. Key determinants of health disparities.
